## **BEST AVAILABLE IMAGES**

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

## IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

APPLICANT: Lockshin, Curtis
APPLICANT: Lockshin, Laxander
APPLICANT: Lockshin, Alexander
APPLICANT: Holmes, Todd
APPLICANT: Holmes, Todd
APPLICANT: Holmes, Todd
APPLICANT: Holmes, Todd
TITLE OF INVENTION: SELF-ASSEMBLY OF AMPHIPHILIC PEPTIDES AND USES
TITLE OF INVENTION: THEREPOR
TITLE OF INVENTION: HEREPOR
TITLE OF INVENTION: HEREPOR
TITLE OF INVENTION: HEREPOR
TITLE OF INVENTION: HOROR:
TONNERS HADDLE FORM:
ADDRESSE: HAMILTON BROOK, SMITH & REYNOLDS, P.C.
CITY: Lexington
CONPUTER: Two Militia Drive
STREE: HOPPY disk
COMPUTER: IBM PC COMPATIBLE
OPERATION TYPE: Floppy disk
COMPUTER: Extentin Release #1.0, Version #1.25
APPLICATION UNBER: US/08/346,849
FILING DATE: SE DECEMBER 1992
APPLICATION NUMBER: US/09/3,326

Sequence 3, Application US/08152488 Patent No. 5534619

GENERAL INFORMATION:
APPLICANT: Wakefield, Thomas W.
APPLICANT: Andrews, Philip C.
APPLICANT: Stanley, James C.
TITLE OF INVENTION: NOVEL PEPTIDES, FOR HEPARIN AND TITLE OF INVENTION: LOW MOLECULAR WEIGHT HEPARIN INUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
ADDRESSEE: Benita J, Rohm, Esq.
STREET: 512 Springfield avenue
CITRE: New Jersey

TELEFAX: 908-276-5533 INFORMATION FOR SEQ ID NO: 3: SEQUENCE CHARACTERISTICS: LENGTH: 29 amino acids

TYPE: amino acid STRANDEDNESS: N/

STATE: New Jersey
COUNTRY: United States of America
21P: 07016-181
. COMPUTER READABLE FORM:
MEDIDM TYPE: Floppy disk
COMPUTER READABLE FORM:
MEDIDM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: MS-D62
CURRENT APPLICATION DATA:
APPLICATION NOWBER: US/08/152,488
FILING DATE: 12-NOV-1993
CLASSIFICATION: 514
PRIOR APPLICATION DATA:
APPLICATION NOWBER: PCT/US92/08069
FILING DATE: 14-NGC-1993
ATOMMER: ROAM: Benita J.
REGISTRATION NUMBER: 28,664
REFERENCE/DOCKET NUMBER: 28,664
REFERENCE/DOCKET NUMBER: RM-7MG
TELEMBHONE: 908-276-3344
MTTELEMBONE: 908-276-5344

TOPOLOGY: N/A MOLECULE TYPE: peptide ORIGINAL SOURCE:

ORGANISM: N/A UBLICATION INFORMATION:

inggeten (tekning ver in grung general ver under under 2004), e.g. in der eine	, and a second program of the	in A was a read of the second	m the second second

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        http://ftp.genome.washington.edu/RM/RepeatMasker.html

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence encodes human integral membrane protein (IMP). IMP may be administered to a subject to treat disorders associated with abnormal ion transport or membrane conductance as well as a variety of tumours, e.g. haemolytic anaemias and prostate, breast and pancreatic tumours. A vector capable of expressing IMP, or a fragment or a derivative thereof, may also be administered to a subject to treat the haemolytic anaemias and prostate, breast and pancreatic tumours.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ·;
                                                                                                                                                                                                                                                                                                                                    This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAX04302) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to $6 novel genes and their fragments (nucleic acid sequences: AAX0431-X04410; amino acid sequences AAW78126-W78225) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the presence of mutations in the new polynocleotides. Specific uses are described for each of the 86 polynocleotides, based on which tissues they are most highly expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      319

Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer

Claim 1; Page 851; 1963pp; English.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and invention also relates to vectors and recombinant host cells comprising a nucleation also relates to vectors and recombinant host cells comprising a nucleation also relates to vectors and recombinant host cells comprising a nucleation also relates to vectors and recombinant host cells comprising an uncleation of the invention. Methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence comprehensive the invention have belongical activities, and hence of premoteration activities; stem cell growth factor activity; and effected activity; immunomodulatory activity; sincel growth activity; and effected activity; immunomodulatory activity; issue growth activity; immunomodulatory activity; activities; haemostatic conference of the moderation activity; in moderatic or chemokinetic activities; haemostatic, thrombotic or thrombotic activity; and activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis.

Cohemotactic or chemokinetic activities; haemostatic, thrombotic or thrombotic activity; and protein or gene therapy. Such conditions include conditions on their biological activities; bracking conditions include conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include conditions include acides encoding them) may be used to promote wound the alsomethy. Polypeptides modely with tissue regeneration and conditions in declinate activity may be used in the treatment of viral, bacterial and fungal infections in addition to immune disease or accidental damage. The polypeptides with growth factor activity may be used in the d ling techniques. The present sequence represents a cDNA encoding a human polypeptide of the invention.

Sequence 1398 BP; 307 A; 408 C; 359 G; 324 T; 0 other;

The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammatopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

The invention relates to novel isolated human secreted polypeptides (I) and polypucleotides (II). (I) and (II) are useful for treating influence and polypucleotides (II). (I) and (II) are useful for treating inclusion injury, shock, sepsis, immune responses, and is involved in increasing haematopoiesis, stem cell survival, bone growth and remodeling; (I), (II) and modulators of (II) are useful for prophylaxis or treatment of one or more cancers. (II) is also useful for prophylaxis or treatment of one or studying the in vivo activities of the polypeptide as well as for studying the in vivo activities of the polypeptides. (I) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, Parkinson's disease, Huntington's disease, and amyotrophic lateral call asorders, in addition, (I) is involved in chemotactic or chemokinetic activity, regulation of haematopoiesis and is useful for treating myaeloid or lymphoid cell disorders, platelet disorders such as thrombocytopenia culcers, for treating ostboorosis, osteoarthritis, bone degenerative culcers, for treating osteoporosis, osteoarthritis, bone degenerative culcers, for treating osteoporosis, osteoarthritis, bone degenerative culcertion or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues, various immune deficiencies and fibroders including severe combined immunodeficiency (SCID), beterial or fibroders including severe combined immunodeficiency (SCID), beterial or fibroders including severe combined immunodeficiency (SCID), beterial or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              fungal infections, autoimmune disorders e.g. multiple sclerosis, rheumatoid arthritis, diabetes mellitus, myasthenia gravis, allergic reactions and conditions, such as asthma or other respiratory problems. In addition, (I) affects biorhythms or circadian cycles of rhythms, fertility, metabolism, catabolism, anabolism, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, provides analgesic effects or other pain reducing effects, immunoglobulin like activity and can act as an antigen in a vaccine composition to raise an immune response. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin or protein as compared to the human protein only. The invention relates to 86 novel genes and their fragments (nucleic acid sequences: AAX04311-X04410; amino acid sequences AAW78126-W78225) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new conditions can be diagnosed by determining the presence of mutations in the new polynuclectides. Specific uses are described for each of the 86 polynuclectides, based on which tissues they are most highly expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunoglobulin

                                                                                                                                                                                                                                                                                                                                      ò
The present invention describes primer sets for synthesising 5602

(111-length cDNAs defined in the specification. Where a primer set
comprises: (a) an oligo-dT primer and an oligonucleotide complementary
comprises: (a) an oligo-dT primer and an oligonucleotide complementary
to the complementary strand of a polynucleotide which comprises one of
the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
polynucleotide which comprises at least 15 nucleotides and the combination of
the 5'-end sequence 3'-end sequence 15 selected from those defined in
the specification. The primer sets can be used in antisense therapy and
in gene therapy. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
certection and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers are also useful for the
cDNAs easily without any specialised methods. AAH03618 and
AAH03633 represent human amino acid sequences; AAB92446 to
AAH036393 represent human amino acid sequences; and AAH13629 to AAH13632
crepresent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ·.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                        Υ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            q
                                                                                                     The present invention describes colon tumour associated proteins (I) and (II) can be used in gene therapy and vaccine production. (I) and (II) can be used in gene therapy and vaccine production. (I) and (II) can be used in the prevention, diagnosis and treatment of diseases associated with inappropriate colon tumour associated protein (TCAP) expression, such as colonic cancer. For example, (I) and (II) may be used to treat disorders associated with decreased expression by credity in mutations or deletions in a patient's genome that affect the activity of TCAPs by expressing inactive proteins or to supplement the production of them. Additionally, (II) may be used to complementary sequences may also be used as DNA probes in diagnostic complementary sequences may also be used as DNA probes in diagnostic complementary sequences may also be used as DNA probes in diagnostic cupin reaction (FCR) and hybridisation assays to detect and quantitate the presence of similar nucleic acids in samples, and theoretore which patients may be in need of restorative therapy. (I) may and in assays to identify modulators of TCAP expression and activity.

Anti-(I) antibodies and antagonists may also be used to down regulate the presence of similar nucleic acids in samples.

Anti-(I) antibodies and antagonists may also be used to down regulate the prepression and activity. The anti-(I) antibodies may also be used as diagnostic agents for detecting the presence of TCAPs expression and activity.

Anti-(I) antibodies and antagonists may also be used to down regulate (e.g. by enzyme linked immunosorbant assay (ELISA). AAI2460 to AAI29512 envent in the examples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been sisolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence was used as the representative sequence from a human clone which was used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    homology searches to identify the clone.
Note: The sequence data for this patent did not form part of the printed
specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Primers useful for synthesizing full length cDNA clones and their

The sequences of the invention are useful in pharmaceutical compositions and vaccines for the prevention and treatment of cancers such as colon cancer. They are also useful for the diagnosis and monitoring of such cancers. Antibodies to the colon tumour proteins and antigen presenting cells that express polynucleotides encoding colon tumour proteins can be used to inhibit the development of cancers. T-cells that react specifically with colon tumour proteins are useful for removing tumour cells from samples (e.g. blood) and for cancer treatment. The polynucleotides sequences are also useful in gene therapy. AAS$7325-AAS$880 represent the cDNA sequences of the invention that encode for portions of human colon tumour proteins.

molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 human cDNA of the invention.
Note: The sequence data for this patent did not form part of the printed

```
The invention relates to isolated breast tumour proteins and nucleic acids that encode them, including immunogenic fragments of the proteins. Also included are expression vectors expressing the proteins. Also included are expression vectors expressing the proteins or proteins, transformed cells and antibodies raised against the proteins or an antigen presenting cell expressing the protein. The proteins and nucleic acids may be used in the prevention, diagnosts and treatment of diseases associated with inappropriate breast tumour protein expression, i.e. breast tumours and breast cancer e.g by gene therapy. The nucleic acids and their complements may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The proteins, nucleic acids and antibodies may be used in assays to identify modulators (e.g. antagonists) of breast tumour protein capression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to as diagnostic agents for detecting the presence of the proteins in samples (e.g. by enzyme linked immunosorbant assay (ELISA)) and in other immuno-purification diagnostic techniques. The present sequence is considered by subtractive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                      1188
